

## ABSTRACT OF THE DISCLOSURE

2 A medal mounting device is comprised of an elongated support bar with first and second  
3 recurved ends. First and second pins are respectively attached to the recurved ends. Spring clips  
4 are detachably attached to the pins. A first end of a springy, forwardly bowed clamping bar is  
5 hinged to the first recurved end and positioned behind the support bar. To use, the support bar is  
6 positioned through the looped ribbons of a plurality of medals. The clamping bar is pressed  
7 against the back of the ribbons, and its free second end tucked under the second recurved end of  
8 the support bar to clamp the ribbons in position. In another embodiment, the clamping bar is  
9 separate from the support bar. In yet another embodiment, the mounting device is comprised of a  
10 T-shaped pin inserted through the ribbon of a medal.
